

Arithmetic Series & Sum of Squares

DESCRIPTION

Given three positive integers representing an arithmetic progression: the first term a , the common difference d , and the number of terms n .

Compute two mathematical values:

1. S_n (The sum of the first n terms):

$$S_n = (n \times [2a + (n - 1)d]) / 2$$

2. $\sum_{k=1}^n k^2$ (The sum of squares of the first n positive integers):

$$\sum_{k=1}^n k^2 = (n(n + 1)(2n + 1)) / 6$$

Write a program that outputs the results strictly formatted with escaped double quotation marks:

```
Sum = "[Sn]", SumSq = "[SumSq]"
```

INPUT FORMAT

The input contains three positive integers a , d , and n separated by spaces ($1 \leq a, d, n \leq 500$).

OUTPUT FORMAT

Print the formatted string on a single line:

```
Sum = "[Sn]", SumSq = "[SumSq]"
```

Replace `[Sn]` and `[SumSq]` with their calculated integer values, followed by a newline.

SAMPLE

Sample Input	Sample Output
3 2 5	Sum = "35", SumSq = "55"
