

Problem 2: Particle Displacement

DESCRIPTION

A particle has an initial velocity of v . If it moves under constant acceleration, the displacement it covers in time $2t$ can be calculated by the formula:

$$\text{Displacement} = 2 \times v \times t$$

Write a program that takes two integers, v and t , and calculates the total displacement in time $2t$.

INPUT FORMAT

The input consists of two integers, v and t , separated by a space.

OUTPUT FORMAT

Print the calculated displacement as an integer, followed by a newline.
