

Problem 4: Relational Operator

DESCRIPTION

Some programming tasks require simple relational decisions. Given two integers, determine the relationship between the first and the second integer by comparing them.

INPUT FORMAT

The input consists of two integers, *a* and *b*, separated by a space.

OUTPUT FORMAT

Print a single character on a line:

- `<` if *a* is strictly less than *b*
- `>` if *a* is strictly greater than *b*
- `=` if *a* is equal to *b*

Follow the output character with a newline.
