

Fast Power of Two Multiplication

DESCRIPTION

In computer architecture, multiplying an integer A by 2^k can be computed extremely quickly using the left-shift bitwise operator ($\ll$). Given two integers A and k , compute $A \times 2^k$ using bitwise shifting.

INPUT FORMAT

The input contains two integers A and k ($1 \leq A \leq 10^6$, $0 \leq k \leq 30$), separated by a space.

OUTPUT FORMAT

Print the resulting value followed by a newline.
