

Meal Total Cost

DESCRIPTION

Given the meal price (base cost of a meal as a floating-point number), tip percentage (an integer), and tax percentage (an integer), calculate and print the meal's total cost rounded to the nearest integer.

The formula is:

$$\text{Total} = \text{meal_cost} + \text{meal_cost} \times (\text{tip_percent} / 100) + \text{meal_cost} \times (\text{tax_percent} / 100)$$

INPUT FORMAT

There are 3 lines of numeric input:

- The first line contains a floating-point number, `meal_cost`.
- The second line contains an integer, `tip_percent`.
- The third line contains an integer, `tax_percent`.

OUTPUT FORMAT

Print the calculated value rounded to the nearest integer, followed by a newline.
